## **Abstract**

This research examines the factors influencing male consumers' intention to purchase Skin Editor body lotion in Bangkok, applying the Theory of Reasoned Action (TRA) as the framework. This study investigates the direct impacts of electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived physical benefit (PPB), subjective norm (SN), and attitude towards behavior (ATT) on purchase intention (PI), and the mediating effect of attitude towards behavior (ATT) between subjective norm (SN) and purchase intention (PI). A quantitative, explanatory approach was used, with the data collected through an online questionnaire, using convenience and snowball sampling. 364 valid responses from male consumers aged 18–40 without prior Skin Editor experience were analyzed by using Jamovi, applying descriptive analysis, reliability testing, multiple linear regression, and mediation analysis. The finding indicated that e-WOM, SMM, PPB, and ATT have significant positive effects on PI, while SN does not have a direct effect on PI however it influences indirectly through ATT. This research enhances academic literature and provides practical insights for skincare brands such as expanding the Theory of Reasoned Action to the relatively untapped male skincare market in Thailand and highlighting the importance of using authentic electronic word-of-mouth to build positive attitudes and purchase intentions among male consumers.

**Keywords:** Male purchase intention, Skin Editor, Body lotion, Skincare marketing, Bangkok

## **Acknowledgement**

This research would not have been happened without the help of many people. First of all, the author would like to sincerely thank to the advisor, Dr. Qizhen Gu, for his continuous support, patience, and valuable guidance throughout this research. Over a long period of time, he has consistently dedicated his time to reviewing my work, offering thoughtful suggestions, and providing constructive feedback that has significantly improved the quality of this study. His encouragement and expertise have been a constant source of motivation, and I am truly grateful for his commitment to helping me succeed.

The author also would like to sincerely thank you to the 421 respondents who participated in the survey, particularly the 364 whose responses met the research criteria. Your willingness to spend time and share your opinions has led to crucial information that serves as the foundation for this research.

Through this research process, I have gained not only academic knowledge but also the ability to apply theoretical concepts to real-life situations. Lastly, the author expect that the findings of this study will provide a valuable reference for future researchers, educators, and companies seeking insights into male skincare consumer behavior or aiming to expand into the male skincare market

# Chapter 1

## Introduction

### 1.1 Background of study

In recent years, the global skincare industry has expanded significantly, it's becoming one of the most profitable and rapidly expanding segments of the beauty and personal care industry. According to Duarte et al. (2025), the global skincare market generated over USD 145 billion in 2022 and is projected to grow to almost USD 210.7 billion by 2028. In addition, Skincare is the most valuable section of the cosmetics industry, accounting for almost 81.7% of global sales of facial care products (Duarte et al., 2025). Despite historically, it's dominated by female consumers, the industry has experienced a major change in recent years. The range of products and consumer demographics is growing these days due to the shift in beauty standards, the influence of the media, and technological advancements in product development.

Consumer behavior has changed as a result of the increase in men's skincare interest. Previously, deodorants and aftershave were the only basic personal care items used in male grooming processes. However, today's men regularly buy body lotions, moisturizers, anti-aging creams, sunscreens, and toners that are tailored to their skin types and lifestyles (Sanny et al., 2020; Simanjuntak et al., 2025). This trend reflects not only cosmetic concerns, but also deeper societal shifts in how masculinity, health, and attractiveness are seen. A growing number of men are looking for skincare solutions to keep their youthful appearance, increase their self-confidence, and improve their physical appearance, the studies have found that over 60% of men today are very concerned about their skin issues (Sanny et al., 2020; Simanjuntak et al., 2025). Especially, the body lotion segment, it is no longer gender-exclusive, men now demand functional products that address dry skin, sun exposure, and pollution—needs especially relevant in tropical climates and urban environments.

This trend is obviously apparent in Asia, where urban male customers are increasing their use of skincare into their daily self-care routines. In Indonesia, South Korea, and Japan, the male grooming market has grown by double digits, reflecting the increase in disposable income and shifting in societal standards (Ferry & Astuti, 2021). According to Vittayavarakorn and Sornsaruht (2024), Thailand, often known as the "ASEAN beauty epicenter", it has developed into one of the region's fastest-growing beauty markets. The Thai cosmetic and skincare sector was valued at more than USD 7.3 billion in 2022, accounting for over 25% of ASEAN beauty product sales (Vittayavarakorn & Sornsaruht, 2024). Male are becoming a more powerful group, particularly in metropolitan areas such as Bangkok, however, women

consumers still account for a substantial percentage of the skincare market. Male customers are starting to realize the benefits of using skincare that can enhance one's social appeal, professional image, and physical attractiveness. The growing demand for men's body lotions and other skincare products has motivated many local and international brands to expand their product lines to include body lotions and other skincare items created exclusively for males.

Even these changes, little is known about the Thai skincare market for male. There is only few information about male consumer behavior, especially their attitudes, motivations, and intentions toward using skincare products such as body lotion because most of studies and marketing strategies keep focusing on women consumers. However, this gap gives academics and marketers a strategic chance to investigate how male skincare purchasing decisions are influenced by subjective norms, perceived physical benefits, social media marketing and electronic word-of-mouth, especially in areas like Bangkok.

Men's skincare usage has been found to be significantly influenced by these societal and personal factors. For instance, previous research indicates that male attitudes on skincare use are significantly influenced by perceived physical benefits such clean skin, anti-aging effects, and enhanced skin tone (Ferry & Astuti, 2021; Simanjuntak et al., 2025). Furthermore, men's decisions to use grooming products are strongly influenced by subjective norms, perceived social pressure from peers or society (Samarasinghe & Jayawardhana, 2020; Simanjuntak et al., 2025). According to Simanjuntak et al. (2025), more than 60% of men are highly concerned about the condition of their skin and believe that skincare can improve their social acceptance and professional appeal.

The growth of digital platforms also influences even more. Especially for young and tech-savvy male customers are increasingly relying on peer recommendations, online reviews, and influencer content due to the growth of electronic word-of-mouth (e-WOM) (Sanny et al., 2020; Samarasinghe & Jayawardhana, 2020). These digital communications are replacing traditional advertising because they are viewed as more trustworthy. As a result, it's influencing consumers' opinions and intentions to buy skincare goods (Samarasinghe & Jayawardhana, 2020).

However, only few studies in the Thai context have examined how e-WOM, subjective norms, social media marketing and perceived physical benefits influence men's attitudes and purchasing intentions. This creates a lack of knowledge in both the academic and practical domain. As a result, the purpose of this study is to investigate the factors that influence male consumers' purchase intentions for Skin Editor body lotion in Bangkok. It aims to better understand how e-WOM, perceived physical benefit, social media marketing, subjective norms and attitudes towards behavior influence the purchase intention. By studying these relationships, this study hopes to provide useful insights for marketers, brand strategists, and researchers who interested in male grooming behavior in Bangkok.

## **1.2 Statement of problem**

Despite the significant growth of the skincare market and growing demand among male consumers, particularly in urban areas such as Bangkok, the market remains relatively untapped in terms of male-specific behavior. While women have typically been the focus of both product development and academic research, men's purchasing behavior particularly for personal care products such as body lotion, have not received much attention from scholars.

This lack of understanding is a barrier for brands that looking to expand into this market. Furthermore, personal and social factors such as perceived physical benefits, subjective norms, and digital influences such as e-WOM and social media marketing have not yet been fully studied in the Thai male context. As a result, there is a need to investigate what factors influence male attitudes and purchasing intentions for skin care products like Skin Editor body lotion in Bangkok.

## **1.3 Research Objectives**

1. To investigate the influence of electronic word of mouth (e-WOM) on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
2. To investigate the influence of social media marketing on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
3. To investigate the influence of perceived physical benefit on attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.
4. To investigate the influence of subjective norm on attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.
5. To investigate the influence of attitude toward behavior on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
6. To investigate the influence of subjective norm on purchase intention toward Skin Editor body lotion among male consumers in Bangkok..
7. To investigate the mediating role of attitude toward behavior between subjective norms and purchase intention.

## **1.4 Research Questions**

1. How does electronic word of mouth (e-WOM) influence purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
2. How does social media marketing influence purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
3. How does perceived physical benefit influence attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.
4. How does subjective norm influence attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.
5. How does attitude toward behavior influence purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
6. How does subjective norm influence purchase intention toward Skin Editor body lotion among male consumers in Bangkok.
7. How does attitude toward behavior mediate the relationship between subjective norms and purchase intention.

## **1.5 Scope of Research**

The target population in this study is male consumers who aged 18 to 40 living in Bangkok and have never used Skin Editor body lotion before. The study emphasizes on males' attitudes and behavioral intentions towards purchasing body lotion products, using a quantitative method with structured questionnaires that delivered online by using Google Form. The sample approach used was non-probability snowball sampling, in which the researcher distributed the questionnaire to friends, acquaintances, and peers, and then asked them to distribute it to more people in their networks. This method enabled the study to reach a larger audience within the target population more efficiently.

In this research, electronic word-of-mouth (e-WOM), social media marketing, perceived physical benefit, subjective norm, and attitude towards behavior are five independent variables that are focused. On the other hand, purchasing intention is the dependent variable. It also investigates the mediating role of attitude toward behavior between perceived physical benefit and purchase intention and between subjective norms and purchase intention. However, the scope is limited to Bangkok-based male

consumers, and the findings reflect their self-reported behavioral intentions rather than actual purchase behavior.

## **1.6 Research limitations**

There are some significant limitations that should be pointed out, even though this study offers valuable insight about purchasing intention toward skincare of male consumers in Bangkok. First, the data may not accurately reflect the opinions or actions of people who live in other region of Thailand or in different countries because the data only comes from men who live in Bangkok. Second, the study employed a non-probability snowball sampling technique, beginning with individuals in the researcher's personal network and progressing through participant referrals. Although this approach helps in reaching the target audience more widely, it might also have resulted in sampling bias because respondents were likely to share similar backgrounds, opinions, or online behaviors. Third, the data was collected by using a self-administered online questionnaire, therefore it may lead to social desirability bias or response bias. Furthermore, because the study was done at a particular point in time, it does not reflect changes in consumer views or behaviors over time. Another limitation is this study has the narrow focus on just Skin Editor body lotion. Therefore, participants' level of familiarity with the brand could have influenced their responses. Finally, the study looked just at purchase intentions, which may not always turn into actual purchasing behavior. Further research can be conducted in order to more understanding of actual consumer activities.

## **1.7 Significance of the Study**

This study is significant for skincare companies, especially those who want to get into Thailand's male skincare market because if the marketers and brand managers understand the personal and social factors that influence men's purchasing decisions, they can create better marketings and product strategies. Furthermore, this study also relates to the academic literature by introducing the Theory of Reasoned Action (TRA) to the context of male skincare behavior. As a result, this study is both practical for business and important to academics.

**Practical Implications for Businesses:** As the market for male skincare products keeps growing, the skincare brands, especially emerging brands like Skin Editor, must adapt their approaches to cope with the changing demands of male customers. This study helps businesses in better understanding what influences men's skincare purchase intentions in Bangkok by identifying and analyzing the roles of

electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived physical benefits, attitude towards behavior, and subjective norms. The skincare brands can use these insights to create more effective marketing campaigns, improve how they communicate and design their product package, choose influencers or brand ambassadors that more suitable with the brand and audience, and create ads that response to the expectations, values, and concerns of male consumers.

**Practical Implications for Academic:** From a theoretical perspective, this study can provide significant insight for academic by applying and expanding the Theory of Reasoned Action (TRA) to the context of male skincare product usage, a topic that is still largely unexplored in Thai academic research. It also adapts classical behavioral models to current technological and social contexts by integrating modern digital factors like social media marketing and e-WOM into the traditional framework and by providing new perspectives on how attitude toward behavior mediates the relationship between external variables like social pressure and product benefits and purchase intentions in skincare products. Therefore, the study provides foundations for further studies on the purchase of skincare products by men, the impact of digital marketing, and consumer insights exclusive to gender.

## 1.8 Definition of Key Terms

**Attitude Toward Behavior:** The individual's learned tendency to behave or engage in the purchase of Skin Editor body lotion (Fishman et al., 2021; Simanjuntak et al., 2025).

**Electronic Word-of-Mouth (e-WOM):** The process of exchanging information about Skin Editor body lotion among potential, current, or past consumers through the internet (Samarasinghe & Jayawardhana, 2020; Macheka et al., 2024).

**Perceived Physical Benefit:** Consumers' perceptions of physical advantages after using Skin Editor body lotion such as protection, restoration, and improvement of skin health (Leung, 2013; Simanjuntak et al., 2025).

**Purchase Intention:** The degree to which male consumers intend or desire to purchase Skin Editor body lotion products in the future after studying it (Mirabi et al., 2015; Simanjuntak et al., 2025).

**Social Media Marketing (SMM):** The use of social media platforms to engage with and influence male consumers' purchase intention to buy Skin Editor body lotion (Moslehpour et al., 2020; Sharma et al., 2022).

**Subjective Norm:** An individual's perception of social support and acceptance for using a Skin Editor body lotion (Hasan & Suciarto, 2020; Noor et al., 2020; Al-Swidi et al., 2014).

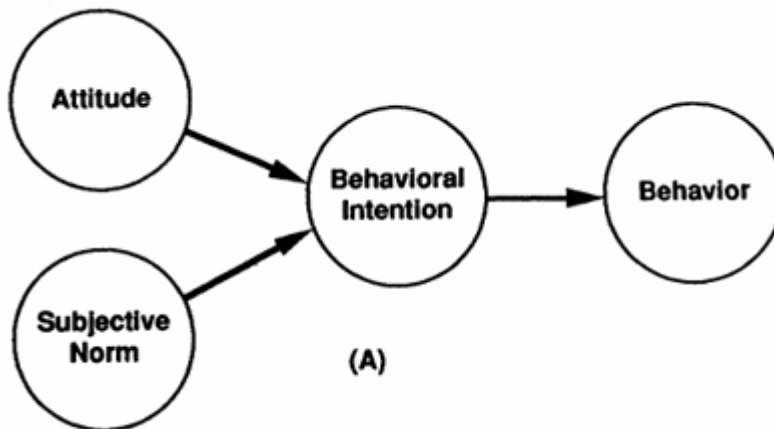

## Chapter 2

### Literature review

#### 2.1 Applied Theory: The Theory of Reasoned Action (TRA)

The Theory of Reasoned Action (TRA) was developed by Fishbein and Ajzen (1975), it is a social psychological model that seeks to explain and predict human behavior by focusing on individual intention as the primary driver of actual behavior (Macovei, 2015). The behavioral intentions, which are the immediate antecedents to behavior, are a function of salient information or beliefs about the likelihood that performing a particular behavior will lead to a specific outcome (Madden et al., 1992). According to TRA, a person's behavioral intention is determined by two main factors: attitude toward the behavior and subjective norm (Macovei, 2015; Truong, 2009; Madden et al., 1992; Simanjuntak et al., 2025)

**Figure 2.1: The Theory of Reasoned Action (TRA)**

**Source:** (Madden et al., 1992)

Attitude toward the behavior refers to an individual's overall evaluation of performing the behavior, whether they see it as favorable or unfavorable. This is influenced by their beliefs about whether the behavior will lead to desired outcomes. (Macovei, 2015; Truong, 2009). Subjective norm refers to perceived social pressure, meaning that it is the individual's belief about whether important people in their life such as family, friends, or colleagues, think they should or should not engage in the behavior.

(Macovei, 2015; Truong, 2009). According to TRA, people act rationally to maximize positive results and avoid letting down others' expectations. That means even if someone has a positive attitude, they might still be influenced to act differently if they believe others expect them to do so or not do so. However, the predictive strength of attitude versus subjective norm can vary by context. For example, when personal influence is stronger, attitude becomes the main driver of intention; conversely, when social expectations dominate, subjective norm becomes more important. (Truong, 2009)

The Theory of Reasoned Action (TRA) has been widely applied in consumer studies, especially those looking at personal care products, digital services, and online shopping (Simanjuntak et al., 2025; Prayitno, 2023; Ramayah & Aafaqi, 2005). For this research, TRA is chosen as the main framework to explore what affects men's intention to purchase Skin Editor body lotion in Bangkok. Based on the theory, men's intention to purchase body lotion can be predicted by their attitudes and subjective norms. Male purchase intention to buy body lotion will be high if they have positive attitudes about it such as believing it will improve their skin. In addition, subjective norms such as perceived social acceptance or expectations from peers, family, or partners. Previous research has also found that both factors, attitudes and subjective norms, significantly influence purchase intentions for personal care products among male consumers (Simanjuntak et al., 2025).

Therefore, the Theory of Reasoned Action (TRA) serves as a suitable theoretical foundation for this research, as it explains the factors that shape men's intention to purchase body lotion. TRA allows this study to systematically analyze how personal attitudes and social factors influence customer decisions in the personal care market. Moreover, TRA has been used in many consumer studies, including those about men's personal care products. This theoretical approach will not only help explain the factors influencing men's purchasing intention, but it will also offer important insights for marketers who looking to expand in the male skincare market.

## **2.2 Variable definition**

### **Purchase intention**

Purchase intention is a decision-making that consumer made by studying the reason to buy a particular brand. (Mirabi et al., 2015). In consumer behavior research, it serves as an indicator of how likely a consumer is to follow and actually make a purchase after assessing factors such as product benefits, pricing, or other relevant information. (Simanjuntak et al., 2025). Some scholars view purchase

intention as the likelihood that a customer will want to make a purchase in the future. Customers don't always decide what to buy, but sometimes they do have the intention of doing it (Sanny et al., 2020). Moreover, Zeqiri et al. (2025) define purchase intention as the probability that a customer intends to or is motivated to buy a good or service in the future. They point out that favorable brand experiences, social media marketing, and word-of-mouth recommendations can all influence a buyer's intention to buy (Zeqiri et al., 2025)

In this study, purchase intention is defined as the degree to which male consumers intend or desire to purchase Skin editor body lotion products in the future after studying it. And it acts as a dependent variable.

## **eWOM**

Electronic word of mouth (eWOM) refers to the knowledge exchange arising in online media, when consumers and potential consumers share their thoughts, experiences, and recommendations about products or services. (Samarasinghe & Jayawardhana, 2020). eWOM is positive or negative feedback from current or previous customers posted on the internet. It is an important channel for customers to talk about product and service quality, reducing risk, uncertainty, and influencing purchase intention. (Padila et al., 2023). These shared messages can significantly impact brand awareness and purchase intention and are frequently seen as more authentic and reliable than traditional advertising. (Utami et al., 2023). Furthermore, previous studies indicate that eWOM is a process in which consumers exchange information about goods, services, or brands via various online channels and can boost customers' confidence and encourage them to try new brands or products when it is viewed as trustworthy, informative, and relevant (Macheka et al., 2024). Especially in the personal care and cosmetics market, eWOM has a significant influence, as consumers are extremely interested in reading other people's opinions before making a purchase, mainly to decrease risk from trying new brands or products. (Samarasinghe & Jayawardhana, 2020)

In this study, Electronic word of mouth is the process of exchanging information about Skin editor body lotion among potential current, or past consumers through the internet. It acts as an independent variable.

## **Social media marketing**

Social media marketing is defined as marketing activities conducted through internet-based networks, which provide an interactive environment for communication and transactions between customers and sellers (Sianturi et al., 2022). According to Saravanakumar and Sugantha Lakshmi (2012), social media marketing is an online marketing strategy that use of platforms like Facebook, Instagram, and TikTok to advertise products, communicate information, and establish two-way relationships with consumers. This strategy is excellent to reach target audiences since it provides entertainment, interaction, customization, trendiness, advertisement, and word of mouth (Moslehpour et al., 2020). In Addition, it is one of the marketing strategies that applied by many successful businesses to be part of the online consumers network (Sanny et al., 2020). According to Yadav and Rahman (2017), Social media marketing is the process by which businesses use social media platforms to develop, communicate, and provide online offerings while building connections with stakeholders through interaction, information exchange, and personalized recommendations (Meliawati et al., 2023). Social media marketing continues to grow significantly due to its capacity to affect customer perceptions of products and purchase behavior (Sharma et al., 2022).

In this study, Social media marketing is defined as the use of social media platforms to engage with and influence male consumers' purchase intention to buy Skin editor body lotion, it acts as the independent variable.

### **Subjective norms**

Subjective norm refers to an individual's perception of social pressure to engage in a specific behavior, influenced by the expectations or opinions of important people in their life like friends, family, or peers, (Hasan & Suciarto, 2020; Noor et al., 2020). In many consumer behavior contexts, subjective norms play a major role in shaping intentions, as people often consider how they will be viewed by their reference groups before making a specific purchase (Al-Swidi et al., 2014). This social pressure can have a direct or indirect influence on an individual's purchasing decisions, especially when it comes to online shopping (Hasbullah et al., 2016). Ajzen (1991) emphasized that normative beliefs are the foundation of subjective norms, as consumers tend to be influenced by public opinion and group expectations (Al-Swidi et al., 2014). Previous research has consistently shown that subjective norm has a significant influence on consumer purchase intentions (Noor et al., 2020). Subjective norms include both injunctive norms, such as believing that one's social network wants them to perform the behavior, and descriptive norms, such as perceiving that peers or family members are themselves performing the behavior (Rhodes & Courneya,

2003). In the context of personal care, consumers' opinion such as males deciding whether to use body lotion, are often shaped by how they believe that those people closest to them will think of this behavior (Simanjuntak et al., 2025).

Thus, the term of "subjective norm" in this study refers to an individual's perception of social support and acceptance for using a Skin Editor body lotion and it acts as an independent variable influencing both attitude toward behavior and purchase intention.

### **Attitude toward behavior**

Attitude refers to an individual's overall evaluation of performing a specific behavior, whether positive or negative. This evaluation is influenced by beliefs about the likely outcomes of the behavior and by the perceived benefits or drawbacks of the behavior (Nisson & Earl, 2020; Fishman et al., 2021). Within consumer behavior, attitude determines whether a person's actions will align with or differ from a particular objective, and directly influences their purchase decisions (Zarei et al., 2019). Attitude is often described as an individual's enduring favorable or unfavorable evaluation, emotional feeling, and action tendency toward a specific object or idea (Pandey et al., 2018). If an individual believes that a behavior will result in positive outcome, they are more likely to have a positive attitude towards it, which increases their intention to engage in it (Steele, 2024; Nisson & Earl, 2020). Empirical studies demonstrating that attitude is a powerful and consistent predictor of intention in a variety of scenarios, including digital piracy, online shopping, and personal care product purchases (Al-Rafee & Cronan, 2006; Simanjuntak et al., 2025). Attitude can be identified into 2 types, attitudes toward objects and attitudes toward behaviors. Attitude toward a behavior refers to the degree to which a person has a favorable or unfavorable assessment or evaluation of the behavior (Al-Debei et al., 2015). According to Simanjuntak et al. (2025), in the context of men's personal care products, attitude refers to a person's learning tendency to act to a product, resulting in a positive or negative mental evaluation. For example, Men who think that using body lotion will make them look better or improve their appearance or provide physical benefits are likely to develop a positive attitude toward using such products, which increases their intention to buy them (Simanjuntak et al., 2025).

In this study, Attitude toward behavior is the individual's learned tendency to behave or engage in the purchase of Skin editor body lotion and act as an mediating variable.

## **Perceived physical benefit**

Perceived benefits are defined as the favorable results that a consumer expects from adopting new behaviors or using a product, and they play a significant part in establishing behavioral intentions and influencing purchasing decisions. (Sidor & Dubin, 2025; Liang et al., 2024). According to Leung (2013), Perceived benefit refers to the perception of advantages that they get from a specific action. For example, when consumers believe that a body lotion would noticeably improve their skin or have a protective benefit, their willingness to try and continue using the product would improve. (Ahmad et al., 2020; Gan & Wang, 2017). This expectation referred to as perceived physical benefit, which reflects consumers' perceptions of the positive and tangible benefits derived from using a product. In the context of personal care, Skin protection, healing, and enhancement are common perceived physical benefits of body lotion and skincare products (Simanjuntak et al., 2025). For example, perceived physical benefits may include smoother skin, fewer wrinkles, or enhanced skin texture, which can raise an individual's confidence and potentially influence their social or professional life (Simanjuntak et al., 2025). Moreover, in previous study, Leung and Man (2002) found that men's positive attitudes towards behavior can rise when they experience physical benefits from using personal care products (Simanjuntak et al., 2025). In summary, customers are more likely to form positive attitudes and intentions towards purchasing or using a product when they think it will provide them significant physical benefits or value (Liang et al., 2024; Al-Debei et al., 2015).

Therefore, in this study, Perceived physical benefit functions as an independent variable influencing attitude toward behavior and it's defined as consumers' perceptions of physical advantages after using Skin editor body lotion such as protection, restoration, and improvement of skin health.

## **2.3 Relationship between variable**

### **Electronic word of mouth and Purchase intention (Utami et al., 2023)**

Previous studies have repeatedly shown that customers' purchase intentions are significantly and favorably influenced by electronic word of mouth, e-WOM (Indrawati et al., 2023; Sarayar et al., 2021). According to Utami et al. (2023), People are more likely to believe reviews from other people than traditional advertising, sharing positive experiences with businesses or items on social media can enhance customer interest in making a purchase. Before making a purchase, consumers are actively searching for

e-WOM to eliminate uncertainty, and they are more likely to purchase products that have received positive user reviews (Navithasulthana et al., 2019)

### **Social media marketing and Purchase intention (Zeqiri et al., 2024).**

Social media marketing has been shown that it has a significant positive effect on consumers' purchase intention in a variety of contexts and countries (Zeqiri et al., 2024). SMM enables active customer engagement, quick sharing of information, and a viral spread of offers, all of which catch attention and inspire consumers to increase purchase intention (Baird and Parasnis, 2011). Previous research frequently shows that customers who have favorable interactions with brands on social media are more likely to want to buy those brands (Dabbous & Barakat, 2020). Similarly, Zeqiri et al. (2024) shown that social media marketing influences purchasing intentions. SMM has an impact at every level of the decision-making process, from recognizing a need and searching for information to evaluating options and making the final decision. (Ranawi et al., 2019)

### **Perceived Physical Benefit and Attitude toward behavior (Simanjuntak et al., 2025)**

According to Simanjuntak et al. (2025), the research finding showed that perceived physical benefits significantly influence attitudes towards men's behavior towards personal care. This is because consumers are more likely to use personal care products when they perceive the benefits, such as protection, restoration, and enhanced skin health. It suggests that males who believe personal care has benefits will have a good attitude towards personal care (Simanjuntak et al., 2025). In previous studies, Leung and Man (2002) found that males who feel physical benefits after using personal care products have more positive attitude towards behavior. Thus, if a person feels that a product truly provides these benefits, they tend to have a positive attitude (Simanjuntak et al., 2025)

### **Attitude toward behavior and Purchase intention (Simanjuntak et al., 2025)**

According to Simanjuntak et al. (2025), the research finding indicates that attitudes toward behavior have a strong positive impact on purchase intention, meaning that attitudes towards behavior can enhance men's purchase intention for personal care products. The finding supports the previous studies, demonstrating a favorable and vital relationship between customer attitudes and purchase intentions (Pusparini et al., 2024; Simanjuntak et al., 2023). Consumers with a good attitude towards personal care

products are more likely to buy and use them since their positive attitude encourages purchasing behavior (Paul et al., 2016; Teng & Wang, 2015; Testa et al., 2016; Wijaya et al., 2021).

### **Subjective Norm and Attitude toward behavior (Simanjuntak et al., 2025)**

According to Simanjuntak et al. (2025), Subjective norms significantly influence attitudes towards men's behavior towards personal care products. The judgement of people closest to them influences men's perceptions of using personal care products, which in turn enhances their opinions and emotions about the likelihood of using these items. The findings show that guys who get support from those important people to use personal care, might develop a good attitude towards personal care. Subjective norms refer to social impacts on individual decision-making, and encouraging words or support from friends, family, or coworkers, can have a favorable impact on one's attitude towards purchasing and using personal care items (Simanjuntak et al., 2025).

### **Subjective Norm and Purchase intention (Simanjuntak et al., 2025)**

According to Simanjuntak et al. (2025), Subjective norms significantly influence purchase intention in various contexts. Simamora and Djamaludin (2020) found that subjective norms act as direct predictors of purchase intention. Purchase intention is positively influenced by subjective norms, especially when it comes to men's purchase intention towards personal care. Therefore, when men use personal care products, their intention to purchase and use these items can be influenced by the opinions of those closest to them. Likewise, people who are significant to that person also influence the decision to abandon the intention to purchase personal care products. The importance of social groups on purchasing intentions is demonstrated by the research's finding that men who receive support from significant people to use personal care will be more likely to purchase personal care products. Additionally, the finding also aligns with previous studies that have examined the relationship between subjective norms and purchase intention (Hansen et al., 2012; Islam & Hani, 2021; Kim & Chung, 2011; Sreen et al., 2021; Simanjuntak et al., 2025).

## **2.4 Previous studies**

**Table 2.1: Summary of previous studies**

| <b>Author(s) &amp; Year</b> | <b>Title/Context</b>                                                                                                                                   | <b>Variables Studied</b>                                                                                                                                                    | <b>Methodology</b>                                                                                                                           | <b>Key Findings</b>                                                                                                                                                                                                                                                                                                                            |

|                      |                                                                                                              |                                                                                                                                                                                     |                                                                                                                                                           | and purchase intention.                                                                                                                                                                                                                                                                                                                    |
| Duarte et al. (2025) | Is masculinity ruining the male skincare market?<br>Comprehensive insights on consumer behavior in cosmetics | Independent variables: Social media use, Self-image concerns, Health concerns, Skin health concerns, Masculinity, Perception of skincare;<br>Dependent variable: Purchase intention | Quantitative study using online survey with 178 male respondents in Portugal; analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM) | Self-image concerns, skin health concerns, and perception of skincare positively influenced purchase intention. Social media indirectly influenced purchase intention through self-image concerns (full mediation). Masculinity negatively influenced purchase intention. Health concerns did not significantly affect purchase intention. |

|                                       |                                                                                                                                                                                             |                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                        |

## Chapter 3

### Research Framework

#### 3.1 Theoretical Framework

**Figure 3.1: Theoretical Framework 1 (The Effect of Acceptance Electronic Word-of-Mouth Information on Intention to Purchase Local Skincare: A Gender Perspective)**

**Sources:** (Utami et al., 2023)

This study aims to examine the effect of acceptance of electronic word-of mouth information on intention to purchase skincare products on social media with the brand awareness variable as the mediator. The framework in this study builds on the previous studies and those studies stated that e-WOM significantly directly affects purchase intentions, it also significantly affects brand awareness and Brand awareness also significantly affects purchase intentions. Furthermore, previous studies stated that e-WOM significantly indirectly affects purchase intention with brand awareness as a mediating variable. Other research also states that gender perspective as a moderator variable can influence the acceptance of e-WOM information on purchase intention. As a result, the key components of this theory are e-WOM, brand awareness, purchase intention, and gender. They distributed a questionnaire via Google form to 400 respondents in Indonesia who are following the skincare account on social media.

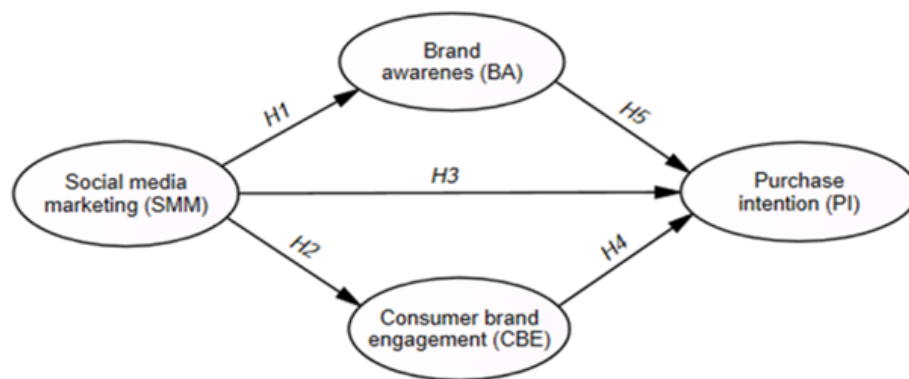

They use a structural equation model (SEM) to calculate the measurement structure of the variables and the relationships between them. To estimate the model, the researcher performed latent

variable regression analysis by using the Partial Least Squares (PLS) technique. From the Analysis of variance or determination test, it shows that brand awareness (BA) is influenced by e-WOM (EW) by 48.2%, while the remaining 51.8% is influenced by other variables outside the variables in this research. Furthermore, the purchase intention (PI) is influenced by e-WOM (EW) and brand awareness (BA) by 47%, while the remaining 53% is influenced by other variables outside the variables in this research.

In this research, they found that electronic word-of-mouth information through brand awareness positively and significantly affects purchase intention. In addition, from the gender perspective, there is no effect between males and females of acceptance of electronic word-of-mouth information on purchase intention skincare products in social media.

**Figure 3.2: Theoretical Framework 2 (The impact of social media marketing on brand awareness, brand engagement and purchase intention in emerging economies)**

Sources: (Zeqiri et al., 2024)

This study examines the influence of social media marketing (SMM) on brand awareness, engagement, and purchase intention in emerging economies. It adopts two theoretical frameworks, the Uses and Gratifications Theory (UGT) and the Consumer Brand Engagement (CBE) theory. UGT is a widely accepted theory for marketing researchers to explain consumer behavior. It's focusing on how individuals use media to achieve their specific purposes, including knowledge enhancement, entertainment, social interaction, and economic benefits. In this framework, UGT is used to explain why customers interact with brand content on social media and how that interaction influences marketing

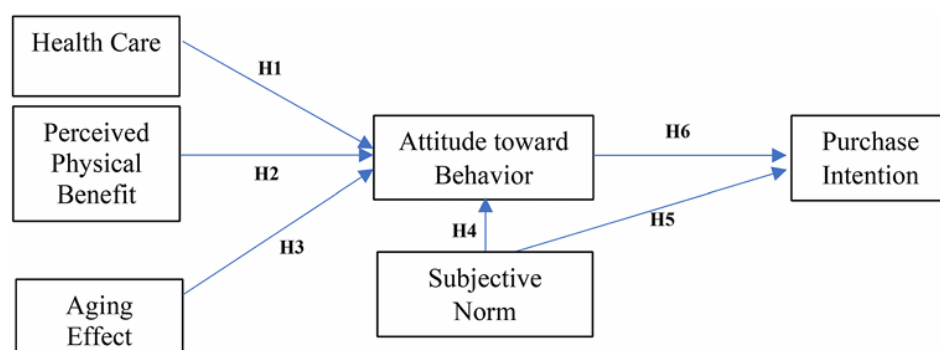

results. The motivations, antecedents, and effects of CBE have been the main focus of CBE theory, it studies on how social media affects customer engagement with brands. It defines brand engagement as consumers' cognitive, emotional, and behavioral involvement with a brand during interactions. This can result in positive brand outcomes such as loyalty or purchase intention.

The key variables of this framework are social media marketing activities (Independent variable), brand awareness (mediating variable), consumer brand engagement (mediating variable), and purchase intention (dependent variable). The study used a structured questionnaire to examine the impact of social media marketing on brand awareness, engagement, and purchase intention on data from 1,808 social media users in North Macedonia, Albania, Kosovo, Romania, and Ukraine. Furthermore, the study utilized SEM to analyze the research model, test the hypothesis, validate the conceptual model, evaluate the measurement model, and estimate the structural model.

The findings showed that social media marketing significantly influences brand awareness (path coefficient = 0.508,  $p < 0.001$ ), brand engagement (path coefficient = 0.468,  $p < 0.001$ ), and purchase intention directly (path coefficient = 0.173,  $p < 0.001$ ). In addition, brand awareness positively influenced purchase intention (path coefficient = 0.128,  $p < 0.001$ ), while brand engagement had an even stronger effect on purchase intention (path coefficient = 0.385,  $p < 0.001$ ). The model explained 81.3% of the variance in purchase intention, 66.6% of the variance in brand awareness, and 66.3% of the variance in brand engagement. Moreover, the country of origin was found to moderate the relationship between brand engagement and purchase intention, but not between social media marketing or brand awareness and purchase intention.

As a result, this framework is relevant to my study because it demonstrates how social media marketing can both directly and indirectly influence male consumers' purchase intentions for skincare products, providing valuable insights of the impact of brand interactions in digital spaces.

**Figure 3.3: Theoretical Framework 3 (Factors influencing men's purchase intention of personal care products: the role of healthcare, physical benefits, aging effects, and subjective norms)**

**Sources:** (Simanjuntak et al., 2025)

This study aims to analyze the influence of healthcare, perceived physical benefits, aging effects, and subjective norms on purchase intention through attitudes toward men's behavior when using personal care products. Fishbein and Ajzen (1967) developed the Theory of Reasoned Action (TRA), which is used in this framework to examine how social and personal factors affect men's intentions to buy personal care products. According to TRA, the main factors that determine behavioral intention are attitudes towards the behavior and subjective norms. Subjective norms are individual perspectives on what seems normal and acceptable in society, while, attitude toward behavior means individual beliefs about these behaviors.

The model in this study extends TRA by introducing personal factors, healthcare awareness, perceived physical benefits, and aging effects, as antecedents of attitudes toward behavior. The key components of the model are these personal factors, healthcare, perceived physical benefit, aging effects, and subjective norms (independent variables), attitude toward behavior (mediator), and purchase intention (dependent variable). Data were collected from 1,994 male respondents in Indonesia, who is 17–65 years old and had used or were currently using personal care products and analyzed using structural equation modeling (SEM).

The findings demonstrated that healthcare ( $\beta = 0.18$ ;  $t = 4.30$ ), perceived physical benefits ( $\beta = 0.32$ ;  $t = 5.20$ ), and subjective norms ( $\beta = 0.54$ ;  $t = 23.43$ ) significantly and positively influenced attitudes toward behavior. It was found that attitude towards behavior was negatively impacted by the aging effect in a minor but significant way ( $\beta = -0.088$ ;  $t = -2.58$ ). Together, these four variables explained 72% of the variations in people's attitudes toward the behavior, with subjective norms having the strongest influence. In addition, both subjective norms ( $\beta = 0.75$ ;  $t = 25.62$ ) and attitude toward behavior ( $\beta = 0.16$ ;  $t = 5.95$ ) together explained 77% of the differences in people's purchase intention. Subjective norms ( $\beta = 0.40$ ;  $t = 17.30$ ) had the strongest indirect impact on purchase intention through attitude. This framework is relevant to my study because it emphasizes the importance of integrating personal health-related beliefs and social influences in understanding male consumers' attitudes and intentions to purchase skincare products, providing valuable insights for marketing strategies targeting this demographic.

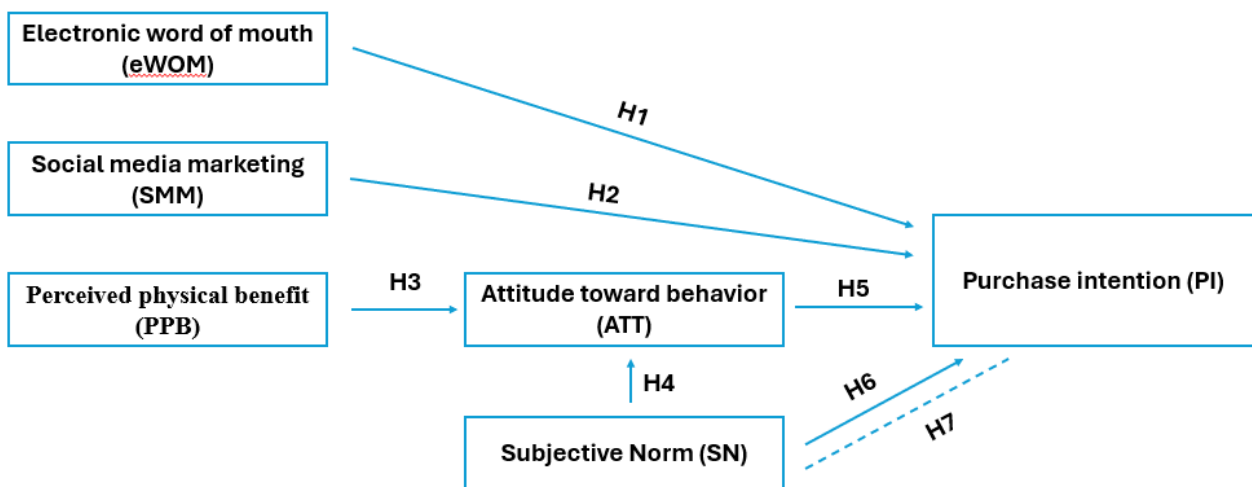

As a result, I developed my conceptual framework by combining significant variables from the three frameworks. Utami et al. (2023) found that e-WOM can directly influence buying intention. Zeqiri et al. (2024) demonstrate how social media marketing can influence purchase intention, both directly and indirectly brand interactions. Lastly, Simanjuntak et al. (2025) emphasize the importance of perceived physical benefits, subjective norms, and attitude toward behavior in predicting male consumers' intentions. Together, these insights guided the design of a framework where e-WOM, social media

marketing, perceived physical benefits, and subjective norms acts as independent variables, attitude toward behavior functions as the mediating variable and purchase intention toward Skin Editor body lotion, dependent variable.

### 3.2 Conceptual framework

This conceptual framework illustrates how key factors influence male consumers' purchase intention toward Skin Editor body lotion in Bangkok. It integrates variables from prior studies, including **e-WOM**, **social media marketing**, **perceived physical benefit**, **subjective norm**, and **attitude toward behavior**, to explain how external, personal, and social factors influence purchase intention.

Figure 3.4: Conceptual Framework

**Sources:** This conceptual framework is conducted by researcher

The conceptual framework illustrates how external, personal, and social factors influence male consumers' purchase intention toward Skin Editor body lotion in Bangkok. **Electronic word-of-mouth (e-WOM)** and **social media marketing (SMM)** are positioned as external factors that directly affect purchase intention. **Perceived physical benefit** and **subjective norm** act as personal and social influences

that shape **attitude toward behavior**, which in turn impacts **purchase intention**. Additionally, subjective norm also has a direct effect on purchase intention. In other words, Electronic word-of-mouth (e-WOM) and social media marketing (SMM), perceived physical benefits, and subjective norms acts as independent variables, while attitude toward behavior functions as the mediating variable and purchase intention toward Skin Editor body lotion is dependent variable. This framework reflects how digital marketing, perceived product benefits, and social expectations work together to drive male consumers' buying decisions for skincare products.

### 3.3 Hypothesis

The researcher constructs the causal hypothesis based on the conceptual framework to research the factors that influence male consumers' purchase intention toward Skin Editor body lotion in Bangkok. The research hypotheses are as below:

**H1:** Electronic word-of-mouth (e-WOM) has a significant positive influence on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.

**H2:** Social media marketing has a significant positive influence on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.

**H3:** Perceived physical benefit has a significant positive influence on attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.

**H4:** Subjective norm has a significant positive influence on attitude toward behavior regarding Skin Editor body lotion among male consumers in Bangkok.

**H5:** Attitude toward behavior has a significant positive influence on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.

**H6:** Subjective norm has a significant positive influence on purchase intention toward Skin Editor body lotion among male consumers in Bangkok.

**H7:** Attitude toward behavior mediates the relationship between subjective norm and purchase intention toward Skin Editor body lotion among male consumers in Bangkok.

### 3.4 Operationalization table:

**Table 3.1: Operationalization table**

| Variable                         | Definition                                                                                                                           | Measurement items                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Scale                | Source/Reference                                                                                                           |

## **Chapter 4**

### **Research Methodology**

#### **4.1 Research Design**

This study uses a quantitative, explanatory research approach to investigate the factors influencing male consumers' purchase intention toward Skin Editor body lotion in Bangkok. The quantitative approach is useful because it allows to conduct the systematic collecting and statistical analysis of numerical data to evaluate hypotheses based on the Theory of Reasoned Action (TRA). The study's design aims to identify the causal relationships between electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived physical benefit, subjective norm, attitude towards behavior, and purchase intention. Because the study aims to explain the direct and indirect effects of these variables, an explanatory method was considered appropriate. A structured questionnaire was used to collect data from June 2025 to July 2025, 1 month period.

#### **4.2 Sampling Procedure**

The target population were male consumers aged 18 to 40 who lived in Bangkok and had never used Skin Editor body lotion before. This group was selected due to their greater use of skincare products and because it aligns with the research objectives.

This research employed non-probability snowball sampling and convenience sampling methods to efficiently access the target demographic. The researcher initially used convenience sampling by distributing an online questionnaire via Google Forms to personal contacts and social media connections. Later, snowball sampling was employed by asking these initial respondents to share the survey to other relevant people. These methods made it possible to reach to a larger and more diversified group within the target population.

According to CEICdata.com (2024), the number of male residents in Bangkok was reported at 2,555,426 persons in 2023. Based on this large population, the researcher determined the appropriate sample size by using the Krejcie and Morgan (1970) table, which suggests a minimum of 384 respondents for populations over 1,000,000. To enhance statistical power and account for incomplete responses, the researcher targeted at least 384 valid responses.

**Table 4.1: Krejcie and Morgan table**

| <i>Total</i> | <i>Sample</i> | <i>Total</i> | <i>Sample</i> | <i>Total</i> | <i>Sample</i> |
|--------------|---------------|--------------|---------------|--------------|---------------|
| 10 ⇒         | 10            | 220 ⇒        | 140           | 1200 ⇒       | 291           |
| 15 ⇒         | 14            | 230 ⇒        | 144           | 1300 ⇒       | 297           |
| 20 ⇒         | 19            | 240 ⇒        | 148           | 1400 ⇒       | 302           |
| 25 ⇒         | 24            | 250 ⇒        | 152           | 1500 ⇒       | 306           |
| 30 ⇒         | 28            | 260 ⇒        | 155           | 1600 ⇒       | 310           |
| 35 ⇒         | 32            | 270 ⇒        | 159           | 1700 ⇒       | 313           |
| 40 ⇒         | 36            | 280 ⇒        | 162           | 1800 ⇒       | 317           |
| 45 ⇒         | 40            | 290 ⇒        | 165           | 1900 ⇒       | 320           |
| 50 ⇒         | 44            | 300 ⇒        | 169           | 2000 ⇒       | 322           |

### **4.3 Research Instrument / Questionnaire Design**

The research instrument was a structured questionnaire developed to measure six key variables: **electronic word-of-mouth (e-WOM)**, **social media marketing (SMM)**, **perceived physical benefit**, **subjective norm**, **attitude toward behavior**, and **purchase intention**. The questionnaire was divided into three main sections:

#### **Section 1: Screening Questions**

Confirmed respondent gender, location, and usage history with *Skin Editor* body lotion, Only the respondent who answer that they are male currently living in Bangkok and have never used Skin Editor body lotion can go to the next section, if not, the questionnaire will go to the end.

### **Part I: Screening Questions**

Are you a male currently living in Bangkok? (คุณเป็นผู้ชายที่อาศัยอยู่ในกรุงเทพหรือไม่?)

- o Yes(ใช่)(Proceed to the next question)
- o No(ไม่ใช่)(End of survey, Thank you)

Have you ever used Skin editor body lotion before? (คุณเคยใช้บอดีโลชั่นของแบรนด์ Skin editor ไหม?)

- o Yes(เคย)(End of survey, Thank you)
- o No(ไม่เคย)(Proceed to the next question)

### **Section 2: Demographic Questions**

Captured basic information such as age group, education level, income, and occupation

### **Part II: Demographic information**

Age (อายุ)

- 18-23
- 24-29
- 30-35
- 35 and above (มากกว่า 35 ปี)

Education (ระดับการศึกษา)

- High school or lower (มัธยมหรือต่ำกว่า)
- Bachelor's Degree(ปริญญาตรี)
- Master's Degree or higher (ปริญญาโทหรือสูงกว่า)

Employment status(สถานะการทำงาน)

- University student(เรียนมหาวิทยาลัย)
- Employee(ลูกจ้าง)
- Self-employed(ประกอบอาชีพอิสระ)
- Unemployed(ว่างงาน)
- Others (อื่นๆ)

Income (Per month) (คุณมีรายได้เท่าไรต่อเดือน)

- Below 15,000 Baht (ต่ำกว่า 15,000 บาท)
- 15,001-30,000 Baht
- 30,001-50,000 Baht
- 50,001-70,000 Baht
- Above 70,000 Baht (มากกว่า 70,000 บาท)

Where do you usually buy skin care product? (ปกติคุณซื้อผลิตภัณฑ์ดูแลผิวจากไหน?)

- TikTok Shop
- Shopee/Lazada
- Physical store(ร้านค้า)
- Other

### **Section 3: Research Variables**

Scale Items for Variables – using validated measures adapted from prior literature, measured on a 5-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree)

### **Part III: Measurement of Dependents and Independent Variables**

#### **Purchase Intention**

|                                                                                                                                                                                                                       |   |   |   |   |   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|---|---|---|---|
| <b>If I see Skin editor body lotion ad on social media, I will look for it.</b><br>(หากฉันเห็นโฆษณา Skin editor body lotion บนโซเชียลมีเดีย ฉันจะค้นหาข้อมูลเกี่ยวกับสินค้านั้น)                                      | 1 | 2 | 3 | 4 | 5 |

To ensure validity and reliability. A pilot test was then conducted using a sample of 40 male respondents from the target population to evaluate the internal consistency of each variable using Cronbach's alpha. all 40 completed questionnaires was analyzed by using Javmovi program. The reliability level of the instrument is represented by Alpha Cronbach. Cronbach alpha was developed by Lee Cronbach in 1951 to assess the internal consistency of a questionnaire or scale. It is given as a number between 0 and 1. Internal consistency refers to how well that all of the items in a test measure the same concept or construct, and it is connected to the inter-relatedness of the items within the test. Internal

consistency should be evaluated before a test is employed for study or evaluation to assure validity (Tavakol & Dennick, 2011). Alpha Cronbach's value above 0.6 is considered high reliability and acceptable index. However, if it's less than 0.6, it will be considered as low (Daud et al., 2018).

**Table 4.2: Pilot test table**

|                                                                                                                                          | <b>Number of items</b> | <b>Mean</b> | <b>Standard deviation</b> | <b>Cronbach's Alpha</b> |
|------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-------------|---------------------------|-------------------------|
| <b>Purchase Intention</b><br><br>Note. Items 'PI 2' and 'PI 3' correlate negatively with the total scale and probably should be reversed | 6                      | 3.36        | 0.577                     | 0.58                    |
| <b>eWOM</b>                                                                                                                              | 8                      | 3.69        | 0.857                     | 0.89                    |
| <b>Social Media Marketing</b>                                                                                                            | 5                      | 3.3         | 1.07                      | 0.912                   |
| <b>Subjective Norms</b>                                                                                                                  | 3                      | 3.37        | 0.794                     | 0.815                   |
| <b>Attitude toward behavior</b>                                                                                                          | 4                      | 3.55        | 0.896                     | 0.93                    |
| <b>Perceived physical benefit</b>                                                                                                        | 4                      | 3.62        | 0.873                     | 0.925                   |

**Sources:** This table is conducted by researcher

As a result, almost all variables—**e-WOM, SMM, perceived physical benefit, subjective norm, and attitude toward behavior** are achieved Cronbach's alpha values above 0.60, indicating acceptable reliability. However, the initial Cronbach's alpha values for **purchase intention** was 0.58, which is below the commonly accepted threshold. The program suggested that the items 'PI 2' and 'PI 3' correlate negatively with the total scale and probably should be reversed.

Consequently, those two items were removed: Item 2: "I intend to buy Skin editor body lotion with designs different from those targeting women." And Item 3: "I intend to buy Skin editor body lotion with the "For Men" label."

After removal, the Cronbach's alpha for purchase intention increased to 0.764, passing reliability requirements. These two items were considered contextually redundant and maybe confusing by respondents since they overlapped conceptually with other higher-performing items. As a result, the final questionnaire included only the most reliable items for the purchase intention variable, to ensure that instrument consistency and compatibility with the study's purpose.

**Table 4.3: Reliability Analysis**

Scale Reliability Statistics

|       | <b>Cronbach's <math>\alpha</math></b> |
|-------|---------------------------------------|
| scale | 0.764                                 |

Item Reliability Statistics

|      | <b>If item dropped</b>                |
|------|---------------------------------------|
|      | <b>Cronbach's <math>\alpha</math></b> |
| PI 1 | 0.735                                 |
| PI 5 | 0.683                                 |
| PI 6 | 0.707                                 |
| PI 4 | 0.708                                 |

#### 4.4 Data Collection

Data collection for this study was conducted during the period of June 15 to July 15, 2025 using an online questionnaire distributed via Google Forms. This method allowed for efficient access to the

target population of male consumers aged 18–40 living in Bangkok, especially through platforms such as Line, Facebook, and Instagram. In order to reach a wider and more diverse sample within the target demographic. The researcher adopted a snowball sampling method, in which initial the researcher initially distributed an online questionnaire via Google Forms to personal connections, asking them to pass it to other potential respondents in their networks.

Before respondent start filling the questionnaire, they were given a brief introduction at the top of the Google Form that explained the study's purpose, the voluntary nature of participation, and promises of privacy. The statement indicated that the obtained data would be used only for academic reasons and will be kept totally secret. Participants filled out the survey freely after reading this information, assuming tacit informed consent.

The study follows fundamental ethical criteria such as anonymous voluntary participation, and data confidentiality. There was no request for personally identifying information such as name, email address, or phone number, and respondents could exit the survey at any time without consequence.

The data collection process, all responses were carefully screened for completeness, consistency, and duplication. All responses I can collect are 421 responses, which exceeded the minimum required sample size of 384 and ensured sufficient statistical power for hypothesis testing. However, some of respondents are female and some have previously used Skin Editor body lotion. As a result, after screening all responses, the sample used for analysis consisted of 364 valid responses,

#### **4.5 Statistical treatment of data**

In this study, Jamovi was used to do statistical analysis to evaluate the research hypotheses and investigate the relationships between the study variables. The analysis approach consisted of several stages, starting with descriptive statistics and progressing to reliability testing, multiple linear regression, and mediation analysis.

##### **Descriptive Analysis**

First, the demographic characteristics of the respondents were summarized by using descriptive analysis. Frequencies and percentages of Important factors such as age, income, employment status, education level, and favorite channel to purchase skincare were calculated. This helped in the interpreting the result of the study and provided a basic summary of the respondent profile. Moreover, the descriptive analysis were also used to investigate central tendencies and patterns in participants' responses of the six variables in this research: electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived

physical benefit (PPB), subjective norm (SN), attitude toward behavior (ATT), and purchase intention (PI). Participants' opinions on a 5-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree), were used to compute the means and standard deviations for each variable.

### **Reliability Analysis**

To confirm the questionnaire's reliability, Cronbach's alpha was applied to assess the internal consistency of each multi-item concept. A value of  $\alpha > 0.60$  was considered acceptable (Daud et al., 2018). The reliability study was initially conducted on a pilot sample of 40 respondents and then confirmed using the entire dataset. This step is done to confirm that all constructs exceeded the minimum reliability criteria and were tested consistently across respondents. Therefore, only statistically valid indicators were retained for further analysis.

### **Multiple Linear Regression Analysis**

Multiple linear regression (MLR) analysis was conducted in two stages for the purpose of hypotheses testing. The first regression model investigated the direct impacts of four independent variables: electronic word of mouth (e-WOM), social media marketing (SMM), subjective norm, and attitude towards behaviour, on the dependent variable, purchase intention (H1, H2, H5, and H6). In the second model, perceived physical benefit and subjective norm were used as predictors of attitude toward behavior, to test H3 and H4. Each regression output included standardized beta coefficients ( $\beta$ ), p-values, R-squared values ( $R^2$ ), and Variance Inflation Factor (VIF) scores.

The standardized beta coefficient ( $\beta$ ) is a statistic used in multiple linear regression to show the strength and direction of the relationship between a predictor variable and the outcome variable. It represents how many standard deviations the outcome variable will change for a one standard deviation increase in the predictor variable. Because standardized beta values are all measured in standard deviation units, the  $\beta$  coefficients become unit-free and directly comparable, regardless of the original scale of the variables. Therefore, we should look at the standardized beta values because they provide better insight into the relative importance of each predictor in the model (Nieminen, 2022; Field, 2009).

The p-value is a popular and helpful statistic for summarizing research findings. It shows the likelihood of receiving the observed data, or more extreme findings, assuming that the null hypothesis is valid (Nahm, 2017; Lakens, 2021). In hypothesis testing, it is used to determine whether differences reported in a study are related to random variation. When the p-value is less than the accepted significance level, often 0.05, researchers often take it as evidence to reject the null hypothesis and conclude that the result is statistically significant (Ferreira & Patino, 2015).

The R-squared ( $R^2$ ) value, or coefficient of determination, is a statistical metric used in multiple linear regression to assess how well the independent variables explain the variance in the dependent variable. It specifically shows the proportion of variance in the outcome that can be predicted using the model's predictors. A higher  $R^2$  value indicates a better fit of the model to the data, accounting for greater variability in the outcome. (Karch 2020; Gao 2023).

The Variance Inflation Factor (VIF) is a diagnostic statistic used in multiple regression analysis to identify and analyze multicollinearity among predictor variables (Akinwande et al., 2015). VIF measures how much the variance of a regression coefficient rises due to multicollinearity. A VIF value of 1 indicates no correlation between predictors; values between 5 and 10 indicate significant multicollinearity; while values greater than 10 are considered problematic. In practice, a VIF less than 5 is usually considered acceptable when determining whether a variable should continue in the model. Researchers frequently employ VIF to identify and remove highly correlated predictors, ensuring that the remaining variables contribute uniquely to explaining the variance in the dependent variable (Akinwande et al., 2015).

### **Mediating analysis**

Even though Multiple regression provides valuable insights into direct effects, but it does not account for indirect influences between variables. One of regression-based analysis's main drawbacks is that it could ignore mediating elements that influence purchase intention. Therefore, a mediation analysis was conducted to test hypothesis H7, in order to overcome the limitation and capture more complicated relationships. This study investigated whether the relationship between subjective norm and purchase intention is mediated by attitude towards behavior. The analysis examined both the direct effect (subjective norm  $\rightarrow$  purchase intention) and the indirect effect through the mediator (subjective norm  $\rightarrow$  attitude  $\rightarrow$  purchase intention). All hypothesis testing in this study was conducted using a significance level of  $p < 0.05$ . Relationships with p-values below this threshold were considered statistically significant and formed the basis for accepting or rejecting the proposed hypotheses.

## Chapter 5

### Research Result

#### 5.1 Reliability Testing

To ensure the validity and reliability of the research instrument, a pilot test was first conducted with a sample of 40 respondents. Cronbach's alpha was used to evaluate the internal consistency of each construct. The results indicated that all variables — electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived physical benefit (PPB), subjective norm (SN), and attitude toward behavior (ATT) — achieved Cronbach's alpha values above the minimum acceptable threshold of 0.60. However, the purchase intention (PI) construct recorded an initial Cronbach's alpha of 0.58, which is below the acceptable level. The item analysis suggested the removal of two items (PI2 and PI3), which subsequently improved the Cronbach's alpha for PI to 0.764, indicating acceptable internal consistency.

Following the full data collection of 364 valid responses, the reliability test was repeated for all constructs. As presented in **Table 5.1**, all variables demonstrated Cronbach's alpha values above 0.60, confirming the questionnaire's internal consistency for the main study. The values ranged from 0.651 (subjective norm) to 0.818 (e-WOM), which are within acceptable limits for social science research, particularly in exploratory studies. This confirms that the measurement items for each construct were reliable for further analysis.

**Table 5.1: Reliability Analysis Results**

| Variable                         | Number of Items | Mean | Standard Deviation | Cronbach's Alpha |
|----------------------------------|-----------------|------|--------------------|------------------|
| Purchase Intention (PI)          | 4               | 3.74 | 0.651              | 0.732            |
| e-WOM                            | 8               | 3.85 | 0.569              | 0.818            |
| Social Media Marketing (SMM)     | 5               | 3.80 | 0.637              | 0.781            |
| Subjective Norm (SN)             | 3               | 3.78 | 0.635              | 0.651            |
| Attitude Toward Behavior (ATT)   | 4               | 3.91 | 0.605              | 0.731            |
| Perceived Physical Benefit (PPB) | 4               | 3.90 | 0.607              | 0.692            |

*Note: All constructs meet the minimum acceptable threshold ( $\geq 0.60$ ) for internal consistency in exploratory studies.*

## 5.2 Descriptive Analysis

This section presents the demographic profile of the 364 respondents who participated in the study. The demographic characteristics include age, education level, employment status, monthly income, and preferred purchase channel for skincare products. The distribution is summarized in **Table 5.2.1 – 5.2.5.**

**Age:** The majority of respondents (51.4%) were between 24 and 29 years old, followed by 36.3% aged 18–23. A smaller proportion were aged 30–35 (7.4%) and above 35 years (4.9%). This suggests that the sample is largely composed of younger consumers, who are often more active in online shopping and social media engagement.

**Table 5.2.1: Table for Frequencies of Age (อายุ)**

| Age (อายุ)                  | Counts | % of Total | Cumulative % |
|-----------------------------|--------|------------|--------------|
| 18-23                       | 132    | 36.3 %     | 36.3 %       |
| 24-29                       | 187    | 51.4 %     | 87.6 %       |
| 30-35                       | 27     | 7.4 %      | 95.1 %       |
| 35 and above(มากกว่า 35 ปี) | 18     | 4.9 %      | 100.0 %      |

**Sources:** This table is conducted by researcher

**Education:** Most respondents held a Bachelor’s degree (69.0%), while 20.6% had a high school education or lower, and 10.4% had a Master’s degree or higher. This indicates a well-educated sample population.

**Table 5.2.2: Frequencies of Education (ระดับการศึกษา)**

| Education (ระดับการศึกษา)                       | Counts | % of Total | Cumulative % |
|-------------------------------------------------|--------|------------|--------------|
| High school or lower (มัธยมหรือต่ำกว่า)         | 75     | 20.6 %     | 20.6 %       |
| Bachelor's Degree(ปริญญาตรี)                    | 251    | 69.0 %     | 89.6 %       |
| Master's Degree or higher (ปริญญาโทหรือสูงกว่า) | 38     | 10.4 %     | 100.0 %      |

**Sources:** This table is conducted by researcher

**Employment Status:** More than half of the respondents were employees (59.1%), followed by university students (26.1%). Self-employed individuals accounted for 11.3%, while unemployed and others made up 1.4% and 2.2%, respectively.

**Table 5.2.3: Frequencies of Employment status(สถานะการทำงาน)**

| Employment status(สถานะการทำงาน)      | Counts | % of Total | Cumulative % |
|---------------------------------------|--------|------------|--------------|
| University student (เรียนมหาวิทยาลัย) | 95     | 26.1 %     | 26.1 %       |
| Employee (ลูกจ้าง)                    | 215    | 59.1 %     | 85.2 %       |
| Self-employed (ประกอบอาชีพอิสระ)      | 41     | 11.3 %     | 96.4 %       |
| Unemployed (ว่างงาน)                  | 5      | 1.4 %      | 97.8 %       |
| Others                                | 8      | 2.2 %      | 100.0 %      |

**Sources:** This table is conducted by researcher

**Income:** Over half (55.5%) reported a monthly income between 15,001–30,000 THB, followed by 24.5% earning below 15,000 THB. Smaller segments earned 30,001–50,000 THB (14.3%), 50,001–70,000 THB (3.3%), and above 70,000 THB (2.5%).

**Table 5.2.4: Frequencies of Income (Per month) (คุณมีรายได้เท่าไรต่อเดือน)**

| Income (Per month) (คุณมีรายได้เท่าไรต่อเดือน) | Counts | % of Total | Cumulative % |
|------------------------------------------------|--------|------------|--------------|
| Below 15,000 Baht (ต่ำกว่า 15,000 บาท)         | 89     | 24.5 %     | 24.5 %       |
| 15,001-30,000 Baht                             | 202    | 55.5 %     | 79.9 %       |
| 30,001-50,000 Baht                             | 52     | 14.3 %     | 94.2 %       |
| 50,001-70,000 Baht                             | 12     | 3.3 %      | 97.5 %       |
| Above 70,000 Baht (มากกว่า 70,000 บาท)         | 9      | 2.5 %      | 100.0 %      |

**Sources:** This table is conducted by researcher

**Purchase Channel:** The most common channel for purchasing skincare products was Shopee/Lazada (53.3%), followed by TikTok Shop (27.5%) and physical stores (19.2%). This highlights the dominance of e-commerce platforms among male skincare consumers.

**Table 5.2.5: Frequencies of Where do you usually buy skin care product?(ปกติคุณซื้อผลิตภัณฑ์ดูแลผิวจากไหน?)**

| Where do you usually buy skin care product?(ปกติคุณซื้อผลิตภัณฑ์ดูแลผิวจากไหน?) | Counts | % of Total | Cumulative % |

### 5.3 Mean and Standard Deviation for Study Variables

This section looks at the average score (mean) and how much the answers vary (standard deviation) for each question in the survey. A higher mean means respondents agreed more with the statement, while a lower mean means they were more neutral or disagreed. A smaller standard deviation means responses were more similar to each other, while a larger one means there was more variety in answers.

#### Purchase Intention (PI):

The four questions about purchase intention had mean scores between 3.68 and 3.80, showing that most respondents agreed they might consider buying the product. **PI1 (M = 3.80)** had the highest score, meaning people were most likely to look for Skin editor body lotion if they saw it advertised on social media. **PI3 (M = 3.68)** was the lowest, showing respondents were slightly less certain about purchasing based only on social media discussions. And the Standard deviations ranged from 0.826 to 0.934, indicating a moderate amount of variation in responses.

**Table 5.3.1: Descriptive analysis table for PI**

#### Descriptives

##### Descriptives

|     | N   | Mean | SD    |
|-----|-----|------|-------|

| PI4 | 364      | 3.76        | 0.859     |

**Sources:** This table is conducted by researcher

#### Electronic Word-of-Mouth (eWOM):

The eight questions about e-WOM scored between 3.79 and 3.93. This means respondents generally agreed that online reviews, comments, and experiences from other customers influence their decision to try or buy the product. **eWOM4 (M = 3.93)** was the highest, showing many respondents are willing to try Skin editor body lotion if it is recommended through online word-of-mouth. Standard deviations ranged from 0.792 to 0.933, meaning differences in answers were not too large.

**Table 5.3.2: Descriptive analysis table for eWOM**

#### Descriptives

| eWOM8 | 364      | 3.79        | 0.884     |

**Sources:** This table is conducted by researcher

#### Social Media Marketing (SMM):

The five questions about SMM had mean scores from 3.74 to 3.88. **SMM2 (M = 3.88)** had the highest score, showing social media is effective for providing the product information people are looking for. **SMM3 (M = 3.74)** scored slightly lower, meaning respondents were a little less likely to share product information with friends themselves, though they still generally agreed. Standard deviations ranged from 0.805 to 0.947, showing a moderate spread of opinions.

**Table 5.3.3: Descriptive analysis table for SMM**

#### Descriptives

| SMM5 | 364      | 3.83        | 0.947     |

**Sources:** This table is conducted by researcher

#### Subjective Norm (SN):

The three questions about subjective norms scored between 3.70 and 3.82. This suggests that people felt some influence from those who are important to them. **SN1 and SN2 (M = 3.82)** were highest, showing that respondents believe important people in their lives would approve of or support them buying the product. **SN3 (M = 3.70)** was slightly lower, suggesting fewer believe that most important people think they should buy it. Standard deviations ranged from 0.794 to 0.874, meaning responses were fairly similar overall.

**Table 5.3.4: Descriptive analysis table for SN**

#### Descriptives

#### Descriptives

|     | <b>N</b> | <b>Mean</b> | <b>SD</b> |
|-----|----------|-------------|-----------|
| SN1 | 364      | 3.82        | 0.794     |
| SN2 | 364      | 3.82        | 0.813     |
| SN3 | 364      | 3.70        | 0.874     |

**Sources:** This table is conducted by researcher

#### Attitude Toward Behavior (ATT):

The four questions about attitude scored between 3.81 and 4.01, showing positive feelings toward using the product. **ATT3 (M = 4.01)** had the highest score in the entire survey, meaning many respondents believe professional skincare treatment like Skin editor body lotion will bring good results. Standard deviations ranged from 0.799 to 0.823, indicating very consistent responses.

**Table 5.3.5: Descriptive analysis table for ATT**

| ATT2         | 364      | 3.92        | 0.814     |
| ATT3         | 364      | 4.01        | 0.823     |
| ATT4         | 364      | 3.90        | 0.819     |

**Sources:** This table is conducted by researcher

**Perceived Physical Benefit (PPB):**

The four questions about physical benefits scored between 3.86 and 3.93. This shows respondents strongly believed the product could give visible improvements to their skin. **PPB1 and PPB4 (M = 3.93)** were highest, showing respondents agreed most with the ideas that Skin editor body lotion can maintain current skin condition and also improve it beyond its original condition. Standard deviations ranged from 0.808 to 0.861, showing most respondents answered in a similar way.

**Table 5.3.6: Descriptive analysis table for PPB**

### 5.4 Multiple linear regression

Multiple linear regression was used to test the research hypotheses. The analysis was conducted in two models:

The first model is testing the direct effects of e-WOM, social media marketing (SMM), attitude toward behavior (ATT), and subjective norm (SN) on purchase intention (PI), testing H1, H2, H5, and H6. The model predicts purchase intention from e-WOM, SMM, ATT, and SN. The model was statistically significant ( $R^2 = 0.474$ , Adjusted  $R^2 = 0.468$ ), meaning that 47.4% of the variance in purchase intention could be explained by these four predictors.

**Table 5.4.1: Multiple Linear Regression model 1**

#### Linear Regression

##### Model Fit Measures

| <b>Model</b> | <b>R</b> | <b>R<sup>2</sup></b> | <b>Adjusted R<sup>2</sup></b> |
|--------------|----------|----------------------|-------------------------------|
| 1            | 0.689    | 0.474                | 0.468                         |

#### Model Coefficients - PI\_Means

| Predictor | Estimate | SE     | t     | p      | Stand. Estimate |
|-----------|----------|--------|-------|--------|-----------------|
| Intercept | 0.4572   | 0.1913 | 2.389 | 0.017  |                 |
| eWOM_Mean | 0.4400   | 0.0674 | 6.530 | < .001 | 0.3847          |
| SMM_Mean  | 0.2341   | 0.0596 | 3.930 | < .001 | 0.2290          |
| ATT_Means | 0.1484   | 0.0571 | 2.599 | 0.010  | 0.1380          |
| SN_Means  | 0.0314   | 0.0507 | 0.619 | 0.536  | 0.0306          |

#### Assumption Checks

##### Collinearity Statistics

|           | VIF  | Tolerance |
|-----------|------|-----------|
| eWOM_Mean | 2.37 | 0.422     |
| SMM_Mean  | 2.32 | 0.431     |
| ATT_Means | 1.92 | 0.520     |
| SN_Means  | 1.67 | 0.600     |

**Sources:** This table is conducted by researcher

The results showed that e-WOM had a significant positive effect on purchase intention ( $\beta = 0.385$ ,  $p < 0.001$ ), supporting H1. This suggests that the more positively respondents perceived online word-of-mouth, the more likely they were to intend to purchase Skin Editor body lotion. Similarly, SMM was found to have a significant positive effect on purchase intention ( $\beta = 0.229$ ,  $p < 0.001$ ), supporting

H2, indicating that effective use of social media marketing increases the likelihood of purchase intention. Attitude toward behavior also significantly predicted purchase intention ( $\beta = 0.138$ ,  $p = 0.010$ ), supporting H5 and showing that respondents with more favorable attitudes toward using the product were more likely to consider buying it. In contrast, subjective norm did not have a significant effect on purchase intention ( $\beta = 0.031$ ,  $p = 0.536$ ), resulting in H6 not being supported. This suggests that social approval or support from important others did not significantly affect respondents' intention to purchase. Collinearity statistics confirmed that there were no multicollinearity concerns, as all VIF values were well below the threshold of 5.

The second model is testing the direct effects of perceived physical benefit (PPB) and subjective norm (SN) on attitude toward behavior (ATT) — testing H3 and H4. The model predicting attitude toward behavior from PPB and SN. The model was also statistically significant ( $R^2 = 0.429$ , Adjusted  $R^2 = 0.426$ ), indicating that 42.9% of the variance in attitude toward behavior could be explained by these two predictors.

**Table 5.4.2: Multiple Linear Regression model 2**

#### Linear Regression

##### Model Fit Measures

| Model | R     | R <sup>2</sup> | Adjusted R <sup>2</sup> |
|-------|-------|----------------|-------------------------|
| 1     | 0.655 | 0.429          | 0.426                   |

##### Model Coefficients - ATT\_Means

| Predictor | Estimate | SE     | t    | p      | Stand. Estimate |
|-----------|----------|--------|------|--------|-----------------|
| Intercept | 1.150    | 0.1693 | 6.79 | < .001 |                 |
| SN_Means  | 0.321    | 0.0470 | 6.83 | < .001 | 0.337           |
| PPB_Means | 0.396    | 0.0492 | 8.05 | < .001 | 0.397           |

#### Model Coefficients - ATT\_Means

| Predictor | Estimate | SE | t | p | Stand. Estimate |
|-----------|----------|----|---|---|-----------------|
|-----------|----------|----|---|---|-----------------|

#### Assumption Checks

##### Collinearity Statistics

|           | VIF  | Tolerance |
|-----------|------|-----------|
| SN_Means  | 1.54 | 0.650     |
| PPB_Means | 1.54 | 0.650     |

**Sources:** This table is conducted by researcher

In the second regression model, the results showed that Perceived physical benefit had a significant positive effect on attitude toward behavior ( $\beta = 0.397$ ,  $p < 0.001$ ), supporting H3 and indicating that respondents who believed more strongly in the product's physical benefits had more positive attitudes toward using it. In addition, Subjective norm also had a significant positive effect on attitude toward behavior ( $\beta = 0.337$ ,  $p < 0.001$ ), supporting H4, which means that the approval or encouragement of important individuals contributed to forming favorable attitudes toward the use of product. Collinearity statistics again indicated no multicollinearity problems, with VIF values of 1.54 for both predictors.

**Sources:** This table is conducted by researcher

A mediation analysis was conducted to examine H7, which proposed that attitude toward behavior mediates the relationship between subjective norm and purchase intention toward Skin Editor body lotion among male consumers in Bangkok. The results showed that subjective norm had a strong and significant positive effect on attitude toward behavior ( $\beta = 0.5717$ ,  $p < 0.001$ ), meaning that approval

or encouragement from important people in respondents' lives helped to create a more favorable attitude toward using the product. In turn, attitude toward behavior had a significant positive effect on purchase intention ( $\beta = 0.1381$ ,  $p = 0.004$ ), showing that respondents with more favorable attitudes were more likely to intend to purchase the product. The indirect effect of subjective norm on purchase intention through attitude toward behavior was also significant ( $\beta = 0.0789$ ,  $p = 0.005$ ), with a 95% confidence interval of 0.0244 to 0.133, which does not include zero, confirming that subjective norm influences purchase intention indirectly by shaping their attitude.

However, when attitude toward behavior was included in the model, the direct effect of subjective norm on purchase intention was no longer significant ( $\beta = 0.0274$ ,  $p = 0.637$ ). This shows that subjective norm does not independently drive purchase intention once attitude is taken into account. The total effect of subjective norm on purchase intention was also non-significant ( $\beta = 0.0547$ ,  $p = 0.280$ ). These results indicate **full mediation**, meaning that subjective norm only affects purchase intention through its effect on attitude toward behavior. Therefore, H7 is supported.

**Table 5.6: Summary of Hypothesis Testing Results**

| Hypothesis | Path                                             | $\beta$                 | p-value | Supported?           |
|------------|--------------------------------------------------|-------------------------|---------|----------------------|

| H7         | SN $\rightarrow$ ATT $\rightarrow$ PI (Indirect) | 0.0789(indirect effect) | 0.005   | Yes (Full Mediation) |

**Sources:** This table is conducted by researcher

Overall, the hypothesis testing results show that most proposed relationships in the conceptual framework were supported. Electronic word-of-mouth, social media marketing, perceived physical benefit, and attitude toward behavior all had significant positive effects on purchase intention. This indicates that positive online reviews and recommendations, effective use of social media platforms, and strong beliefs in the product's benefits are important factors in increasing purchase intention. In contrast, subjective norm did not have a direct impact on purchase intention, suggesting that the opinions of important people alone are not enough to influence the decision to purchase. However, the mediation analysis revealed that subjective norm significantly affects purchase intention indirectly by first shaping attitude toward behavior. This means that social approval or encouragement works by improving attitudes toward the product, which in turn increases the likelihood of purchase.

## Chapter 6

### Discussion and Recommendation

#### 6.1 Discussion of Findings

This study investigated the factors influencing purchase intention toward Skin Editor body lotion among male consumers in Bangkok, using the Theory of Reasoned Action (TRA) as the guiding framework. The hypotheses focused on the effects of electronic word-of-mouth (e-WOM), social media marketing (SMM), perceived physical benefit (PPB), subjective norm (SN), and attitude toward behavior (ATT) on purchase intention (PI), along with the mediating role of attitude toward behavior in the relationship between subjective norm and purchase intention.

The findings from multiple regression analysis showed that e-WOM had a significant positive effect on purchase intention (H1 supported). This aligns with previous studies, [Utami et al. \(2023\)](#), that online reviews and peer recommendations strongly influence consumers' decisions. In the context of male skincare, this suggests that men in Bangkok rely on online experiences shared by others to reduce uncertainty and confirm product quality before making a purchase.

Social media marketing also had a significant positive effect on purchase intention (H2 supported), consistent with [Zeqiri et al. \(2024\)](#), who highlight that engaging content and easy access to product information via social media can enhance consumer interest. This suggests that visually appealing and informative social media campaigns are an effective way to encourage purchase intentions among male skincare consumers.

Perceived physical benefit significantly influenced attitude toward behavior (H3 supported). This finding consistent with [Ferry and Astuti \(2021\)](#) and [Simanjuntak et al. \(2025\)](#), showing that beliefs about visible improvements to skin condition can strengthen favorable attitudes toward a product. In the case of Skin Editor body lotion, highlighting tangible outcomes such as skin hydration, texture improvement, and prevention of skin issues can play a critical role in shaping positive attitudes.

Subjective norm significantly influenced attitude toward behavior (H4 supported), which is consistent with TRA's premise that the opinions of important others can shape individual attitudes toward a behavior. For male consumers, approval from peers, partners, or family may create social validation, making skincare use feel more acceptable and even desirable.

Attitude toward behavior significantly influenced purchase intention (H5 supported). This is in line with TRA theory and previous studies, [Simanjuntak et al. \(2025\)](#), confirming that positive attitudes toward using a product increase the likelihood of purchase.

However, subjective norm did not have a significant direct influence on purchase intention; thus, Hypothesis 6 is not supported. Therefore, it contrasts with the findings from prior research such as the study that conducted by Simanjuntak et al. (2025), which shown that social pressure and subjective norms had a direct influence on purchase intention. Nevertheless, the conclusion aligns with the findings of Ruslim et al. (2022), which indicated that subjective norms did not have a significant direct influence on the intention to purchase green skincare products in Jakarta. They said that the consumers often choose to use green products based on their own beliefs, not because someone else told them to or because they were influenced by someone else. In the context of the current study, it is also possible that in the male skincare market, the intention to purchase is mainly influenced by personal conviction and individual views rather than direct social pressure from peers, family, or other influential individuals.

Finally, the mediation analysis showed that attitude toward behavior fully mediated the relationship between subjective norm and purchase intention (H7 supported). This means that while subjective norm alone does not directly influence the purchase intention, it works indirectly by shaping a favorable attitude, which then increases purchase intention. This finding strengthens TRA's argument that attitude plays a central role in linking social influence to behavioral intention.

## **6.2 Theoretical Implications**

This research makes several contributions to academic literature. First, it extends the Theory of Reasoned Action into the context of male skincare consumption in Bangkok, a segment that has been underexplored in previous studies. Second, it confirms the full mediating role of attitude toward behavior between subjective norm and purchase intention in this context, suggesting that social influence works indirectly through attitude rather than directly shaping intentions. Third, it provides empirical evidence that e-WOM and SMM are both significant drivers of purchase intention, highlighting the growing importance of digital communication channels in personal care markets.

## **6.3 Practical Implications**

The findings also offer actionable insights for Skin Editor and other similar skincare brands. Leveraging authentic e-WOM is crucial, and brands should encourage satisfied customers to share before-

and-after photos, testimonials, and reviews on social media and e-commerce platforms. Social media marketing content also should be enhanced by providing informative, visually appealing posts that address common male skincare concerns, along with interactive elements such as polls, Q&A sessions, and influencer collaborations. Marketing campaigns should highlight physical benefits clearly, using specific claims such as “visible results in two weeks” supported by credible evidence or demonstrations. It is also important to build positive attitudes toward skincare use among men by using relatable male role models and influencers to normalize skincare routines. Finally, as social approval alone is not enough to drive purchase intention, marketing should focus on shaping positive personal attitudes through education and demonstration of benefits.

#### **6.4 Limitations of the Study**

Despite this research offers significant insights, however, it also has several limitations. First, the sample was limited to male consumers in Bangkok, potentially limiting the applicability of the findings to other regions or to female consumers. Second, the study employed non-probability sampling methods, especially convenience sampling and snowball sampling, which may lead to selection bias and restrict the representativeness of the sample. Third, the study relied on self-reported data, which may be subject to response bias or social desirability bias. Finally, the cross-sectional design captures relationships at a single point in time, consequently it can't establish causality between variables.

#### **6.5 Suggestions for Future Research**

Future research could expand the scope by including other demographic groups, such as female consumers, older age segments, or even other regions, to examine whether the findings hold across different populations and locations. Researchers could also explore additional mediators, such as brand trust or perceived value, to gain a deeper understanding of how social and psychological factors influence purchase intention. Conducting longitudinal or experimental studies would help establish causal relationships between variables. Furthermore, Comparing the results across different skincare brands or product categories could identify both similarities and differences in the factors that influence purchase intention.

## **6.6 Conclusion**

This study explored the effects of e-WOM, social media marketing, perceived physical benefit, subjective norm, and attitude toward behavior on purchase intention toward Skin Editor body lotion among male consumers in Bangkok. The results confirm that e-WOM, SMM, perceived physical benefit, and attitude toward behavior are important predictors of purchase intention, while subjective norm influences intention only indirectly through attitude. These findings reinforce the central role of attitude in the Theory of Reasoned Action and highlight the importance of digital communication channels and perceived product benefits in driving purchase decisions in the male skincare market. By combining theoretical contributions with practical recommendations, this research provides valuable guidance for both academics and practitioners interested in understanding and influencing male consumer behavior in the personal care industry.

## APPENDIX A

### Questionnaire

#### Research Title: **Factors Influencing the Purchase Intention Toward Skin editor Body Lotion Among Males in Bangkok**

Hi guys, as part of our Master's Degree studies, we are conducting research to explore the factors influencing purchase intention toward Skin Editor body lotion. In order to ensure the accuracy and reliability of our findings, we kindly ask for your cooperation in completing this questionnaire. Your responses are extremely valuable to our research. Please be assured that all information you provide will be treated with strict confidentiality and used solely for academic purposes. We greatly appreciate your time and support. Thank you very much for your participation.

#### Section 1: Screening Questions

Confirmed respondent gender, location, and usage history with *Skin Editor* body lotion, Only the respondent who answer that they are male currently living in Bangkok and have never used Skin Editor body lotion can go to the next section, if not, the questionnaire will go to the end.

#### Part I: Screening Questions

Are you a male currently living in Bangkok? (คุณเป็นผู้ชายที่อาศัยอยู่ในกรุงเทพฯหรือไม่?)

- ☐ Yes(ใช่)(Proceed to the next question)
- ☐ No(ไม่ใช่)(End of survey, Thank you)

Have you ever used Skin editor body lotion before? (คุณเคยใช้บอดี้โลชั่นของแบรนด์ Skin editor ไหม?)

- ☐ Yes(เคย)(End of survey, Thank you)
- ☐ No(ไม่เคย)(Proceed to the next question)

#### Section 2: Demographic Questions

Captured basic information such as age group, education level, income, and occupation

#### Part II: Demographic information

Age (อายุ)

- 18-23

- 24-29
- 30-35
- 35 and above (มากกว่า 35 ปี)

#### Education (ระดับการศึกษา)

- High school or lower (มัธยมหรือต่ำกว่า)
- Bachelor's Degree(ปริญญาตรี)
- Master's Degree or higher (ปริญญาโทหรือสูงกว่า)

#### Employment status(สถานะการทำงาน)

- University student(เรียนมหาวิทยาลัย)
- Employee(ลูกจ้าง)
- Self-employed(ประกอบอาชีพอิสระ)
- Unemployed(ว่างงาน)
- Others (อื่นๆ)

#### Income (Per month) (คุณมีรายได้เท่าไรต่อเดือน)

- Below 15,000 Baht (ต่ำกว่า 15,000 บาท)
- 15,001-30,000 Baht
- 30,001-50,000 Baht
- 50,001-70,000 Baht
- Above 70,000 Baht (มากกว่า 70,000 บาท)

#### Where do you usually buy skin care product? (ปกติคุณซื้อผลิตภัณฑ์ดูแลผิวจากไหน?)

- TikTok Shop

- Shopee/Lazada
- Physical store(ร้านค้า)
- Other

### Section 3: Research Variables

Scale Items for Variables – using validated measures adapted from prior literature, measured on a 5-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree)

### Part III: Measurement of Dependents and Independent Variables

#### Purchase Intention

Purchase intention is defined as the desire of an individual to buy a desired goods after learning more about it.

|                                                                                                                                                                                                                |   |   |   |   |   |
